Microscope Camera Coupler Provides Oversized Clear Aperture to Take Advantage of New CCD Arrays in Scientific and Industrial Imaging Cameras

Boynton Beach, FL – Tower Optical Corp. has just announced the availability of a 1.0X C-Mount Camera Coupler for microscopes with a standard 38mm ISO photoport. This new coupler provides a Clear Aperture (CA) of more than 20mm thereby allowing use of larger CCD arrays in the latest Scientific and Industrial imaging cameras.

General

The Camera Coupler is an important accessory for today's modern microscope. It allows the use of video CCD cameras to capture valuable images during Research and Development, Failure Analysis, scientific investigation as well as other microscopy applications.

The magnification factor of the CC-1X is 1.0X. The CC-1X provides a clear aperture of more than 20mm, larger than most similar products, providing both increased field-of-view and light transmission of the microscope image to the camera.

The Model CC-1X's catalog part number is 0535-0012.

Pricing and Availability

The Model CC-1X (0535-0012) is available from Tower Optical Corp. for \$89.00 USD. Reseller pricing is available starting at a 30% discount. Camera Couplers are available from stock. For more information visit www.TowerOptical.com or contact the Tower Sales Department via email at sales@TowerOptical.com. Additional promotional material is also available.
